PROBLEM STATEMENTS

- The Communication Gap: Traditional reporting (calls/emails) is slow, lacks precise location data, and provides no status updates to citizens.
- The Resource Burden: Municipalities are overwhelmed by unverified or duplicate reports, wasting time and taxpayer money.
- The Trust Deficit: No system exists to distinguish between high-priority community needs and "spam" or fake reports.
- The Impact: Neglected infrastructure and a lack of accountability in urban management.

PROJECT DESCRIPTION

- Geospatial Reporting: Interactive map interface for precise location tagging with photo evidence.
- Social Verification (Voting): A community-driven consensus model where citizens "upvote" real problems, ensuring only legitimate issues reach the municipality.
- Dynamic Reputation System: An algorithm that assigns "Trust Scores" to users based on the accuracy and resolution of their past reports.
- Municipality Workflow: A professional dashboard for city officials to view reports on a heat map, update statuses (In Progress/Resolved), and notify the public in real-time.
